

sinfónica

Biótica

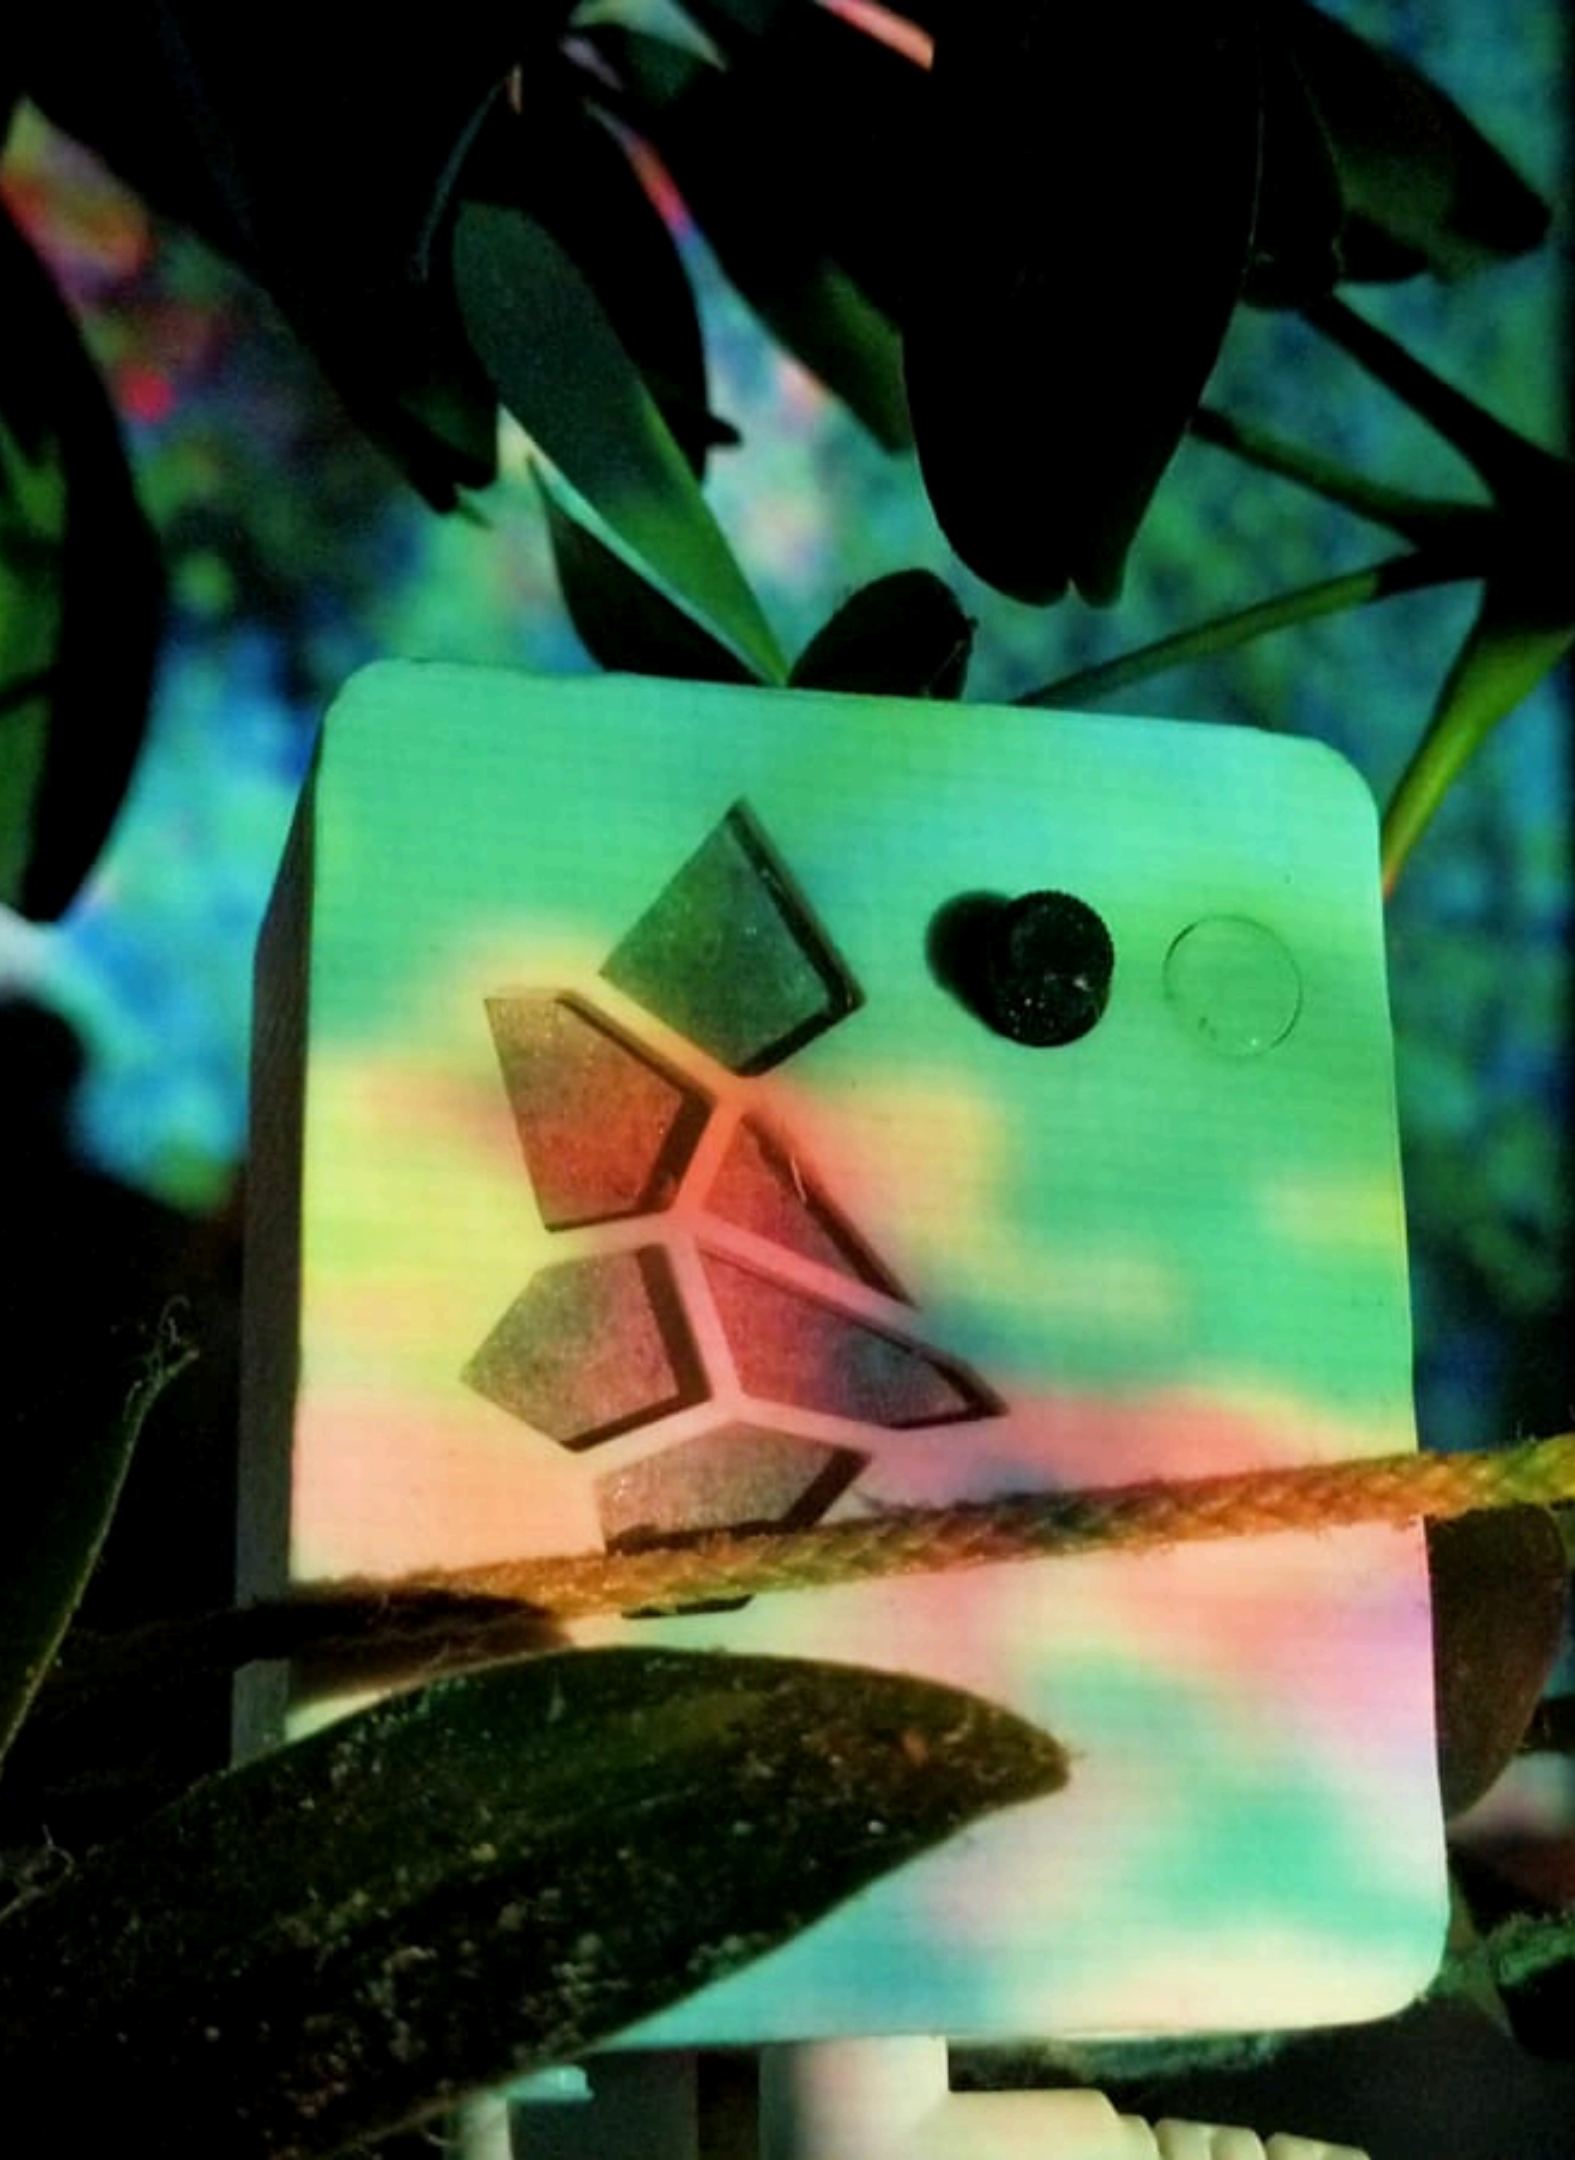

The background of the slide is a dark, textured surface covered with a dense field of small, multi-colored particles and bokeh. On the left side, there are larger, more distinct bokeh circles in shades of yellow, green, and blue. The overall effect is reminiscent of a microscopic view of a complex system or a digital particle simulation.

Sinfonía biótica

Is an inter-species creative ecosystem. A virtual reality experience in which human beings and non-animal organisms –such as plants and fungi– will collaborate in the creation of an interactive audiovisual piece.

Each of these organisms within the symphony –based on the data generated by their electrical impulses, movements and sounds– will interpret a part of the sound biocomposition.

The movements and interactions of the player will be added to the unique and unrepeatable collaborative piece as another instrument.

The tech behind it

Transforming real-world nature data
into an immersive artwork

The aim of the project is to better understand other organisms as to develop sensitivity towards other life forms and non-human entities.

To do so, we use different technologies and methodologies:

- **Biodata**: an opensource hardware device that allows us to amplify and record the electrical impulses of plants, as well as variables such as humidity, temperature, electroconductivity of the soil.
- **Photogrammetry** and **radiance fields** to digitise natural environments and physical bodies of trees.

The code of “Sinfonía biótica” is free and opensource for anyone interested in participating.

Roadmap

2024

- Digitisation of more than 10 specimens of century-old trees from the Iberian Peninsula (oak, cork oak, plane tree, ash, redwood, holm oak, yew)
- Creation of a virtual reality experience
- Experiential and technical workshops
- Publication of the experience
- Creation of interactive installations

2025 – Objectives

- Presentation of the VR experience at festivals
- Digitisation proposal to Botanical Gardens and Natural Parks
- Prototyping of a real time data collector
- Creation of a real-time data platform
- Expansion of collected organisms
- Training machine learning models with real data

Interspecies creative ecosystems
